Modularized implementation: forward / backward API

Graph (or Net) object (rough psuedo code)

```
class ComputationalGraph(object):
# . . .
def forward(inputs):
     # 1. [pass inputs to input gates...]
     # 2. forward the computational graph:
     for gate in self.graph.nodes_topologically_sorted():
         gate.forward()
     return loss # the final gate in the graph outputs the loss
def backward():
     for gate in reversed(self.graph.nodes topologically sorted()):
         gate.backward() # little piece of backprop (chain rule applied)
     return inputs gradients
```
